

Features & Benefits

foodservice filtration systems

High-Quality Water

Water isn't only for drinking. We use it every day for cleaning, sanitizing, food preparation, and personal hygiene. VZN systems are each certified under NSF 53 for cyst reduction so that your water is always safe. The .015 micron ultrafilter substantially reduces particles, which allows you to enjoy all of the benefits of high-quality water.

Low Cost of Ownership

In VZN systems with a carbon cartridge, the preceding ultrafilter performs the mechanical filtration. This means the carbon cartridge only reduces tastes and odors, so it always performs to its stated life expectancy and only needs to be replaced once a year at a low cost.

Low Maintenance

VZN systems have a self-cleaning ultrafilter that eliminates premature clogging on the carbon cartridge, greatly reduces the number of maintenance issues and allows the system to operate automatically with little user intervention.

Lime Scale Protection

VZN systems equipped with TAC (Template-Assisted Crystallization) technology decrease lime scale by 96–98% without using chemicals or wasting water, providing an environmentally friendly option that reduces service issues and protects your pipes, fixtures, and appliances.

Small Footprint

Buying bottled water is costly to your wallet and to the environment, with more than 170 million bottles ending up in landfills each year. VZN systems bring high-quality water to every faucet in your home, eliminating the need for bottled water and reducing your impact on the environment.
